☐ Continuation Sheet Attached

## Brief Description of Argument to be Presented:

The amendments provided in the Response dated March 10, 2010 will be discussed. Briefly, in Bosman, the terminal of the connector pin is extended on the outer periphery of the bobbin. By contrast, in the present invention (as recited in independent claim 3) it is "the (extended) portion on the distal end side" of the connector pin that is extended on the outer periphery side of the bobbin. In the present invention (as recited in independent claim 3), both the terminal portion on the proximal end side and the extended portion on the distal end side (i.e., of the connector pin) are located along the end surface of the axial direction of the bobbin. Thus, the present invention (as recited in independent claim 3) has the advantage that the height in an axial direction relative to the flange surface 50a for fitting the motor is sustained. No such features or advantages of the present invention (as recited in independent claim 3) are provided by Bosman.

An interview was conducted on the above-identified application on \_\_\_\_\_

**NOTE: This form should be completed by applicant and submitted to the examiner in advance of the interview (see MPEP § 713.01).**

**This application will not be delayed from issue because of applicant's failure to submit a written record of this interview. Therefore, applicant is advised to file a statement of the substance of this interview (37 CFR 1.133(b)) as soon as possible.**
